Docket No. AT999179  
Firm No. 0072.0014

This listing of claims will replace all prior versions, and listings, of claims in the application:

**Listing of Claims**

1. (Currently Amended) A method for accessing variables from an operating system, comprising:

receiving a command from an application program for at least one variable maintained by the operating system;

determining whether the at least one variable is in a data object;

if the at least one variable is in the data object, returning the at least one variable to the application program; and

if the at least one variable is not in the data object,

executing the command from the application program to store at least one variable maintained by the operating system in the data object accessible to the application program, wherein the application program is executing on the operating system ; by:

determining an operating system native command from a set of native operating system commands for different types of operating systems to use to retrieve the at least one variable, wherein the application program is capable of executing on each of the different types of operating systems;

executing the determined operating system native command in response to the command from the application program to retrieve the at least one variable into a buffer;

storing the retrieved at least one variable from the buffer into the data object; and

executing the command from the application program to retrieve the at least one variable from the data object for return to the application program.

2. (Cancelled)

Docket No. AT999179  
Firm No. 0072.0014

3. (Original) The method of claim 1, wherein the application program is a first application program, further comprising:
- receiving a request from a second application program for at least one variable maintained by the operating system; and
  - returning the requested at least one variable from the data object populated as a result of the command executed by the first application program.
4. (Previously Presented) The method of claim 1, wherein the at least one variable retrieved as a result of execution of the command from the application program is a set of environment variables.
5. (Currently Amended) The method of claim 1, further comprising:
- determining a type of the operating system; and
  - selecting the operating system native command from a the set of native operating system commands for different types of operating systems, wherein the selected operating system native command is capable of being executed on the operating system to retrieve the at least one variable; ~~and wherein the application program is capable of executing on each of the different types of operating systems.~~
6. (Previously Presented) The method of claim 1, wherein the command from the application program and the operating system native command are executed in a first process and the application program is executed in a second process.
7. (Previously Presented) The method of claim 1, wherein the command from the application program is for storing multiple variables, and wherein retrieving the variables comprises generating a data stream including the variables, further comprising:
- reading the variables from the data stream into the buffer; and

Firm No. 0072.0014

processing each line in the buffer to determine each variable name and value, wherein each determined variable name and value is stored in the data object.

8. (Original) The method of claim 7, wherein determining each variable name and value comprises:

- determining a location of an equal sign;
- setting the variable name to the string preceding the equal sign; and
- setting the variable value to the string following the equal sign.

9. (Previously Presented) The method of claim 8, wherein the variable name and value for each variable are maintained on at least one line, further comprising:

- processing each line in the data stream line-by-line;
- determining whether each line includes the equal sign, wherein, for each line including the equal sign, the variable name is set to the string preceding the equal sign and the variable value is set to the string following the equal sign; and
- appending the content of each line not including the equal sign to the variable value.

10. (Currently Amended) A computer system for accessing variables from an operating system, comprising:

- a computer;
- a memory storing at least one variable;
- program logic executed by the computer, comprising:
  - means for receiving a command from an application program for at least one variable maintained by the operating system;
  - means for determining whether the at least one variable is in a data object;
  - if the at least one variable is in the data object, means for returning the at least one variable to the application program; and

Docket No. AT999179  
Firm No. 0072.0014

if the at least one variable is not in the data object,

(i) means for executing the command from the application program to store at least one variable maintained by the operating system in the data object in the memory accessible to the application program, wherein the application program is executing on the operating system; with:

(ii) (i) means for determining an operating system native command from a set of native operating system commands for different types of operating systems to use to retrieve the at least one variable, wherein the application program is capable of executing on each of the different types of operating systems;

(iii) (ii) means for executing the determined operating system native command in response to the command from the application program to retrieve the at least one variable into a buffer;

(iv) (iii) means for storing the retrieved at least one variable from the buffer into the data object; and

(v) (iv) means for executing the command from the application program to retrieve the at least one variable from the data object for return to the application program.

11. (Cancelled)

12. (Original) The system of claim 10, wherein the application program is a first application program, wherein the program logic further comprises:

means for receiving a request from a second application program for at least one variable maintained by the operating system; and

means for returning the requested at least one variable from the data object populated as a result of the command executed by the first application program.

Firm No. 0072.0014

13. (Previously Presented) The system of claim 10, wherein the at least one variable retrieved as a result of execution of the command from the application program is a set of environment variables.

14. (Currently Amended) The system of claim 10, wherein the program logic further comprises:

means for determining a type of the operating system; and

means for selecting the operating system native command from a the set of native operating system commands for different types of operating systems, wherein the selected operating system native command is capable of being executed on the operating system to retrieve the at least one variable, and wherein the application program is capable of executing on each of the different types of operating systems.

15. (Previously Presented) The system of claim 10, wherein the program logic further comprises means for executing the command from the application program and the operating system native command in a first process and mean for executing the application program in a second process.

16. (Previously Presented) The system of claim 10, wherein the command from the application program is for storing multiple variables, and the program logic for retrieving the variables comprises means for generating a data stream including the variables, and where the program logic further comprises:

means for reading the retrieved variables from the data stream into the buffer; and

means for processing each line in the buffer to determine each variable name and value, wherein each determined variable name and value is stored in the data object.

Firm No. 0072.0014

17. (Original) The system of claim 16, wherein the program logic for determining each variable name and value comprises:

- means for determining a location of an equal sign;
- means for setting the variable name to the string preceding the equal sign; and
- means for setting the variable value to the string following the equal sign.

18. (Previously Presented) The system of claim 17, wherein the variable name and value for each variable are maintained on at least one line, and wherein the program logic further comprises:

- means for processing each line in the data stream line-by-line;
- means for determining whether each line includes the equal sign, wherein, for each line including the equal sign, the variable name is set to the string preceding the equal sign and the variable value is set to the string following the equal sign; and
- means for appending the content of each line not including the equal sign to the variable value.

19. (Currently Amended) An article of manufacture for use in accessing variables from an operating system, the article of manufacture comprising computer useable media accessible to a computer, wherein the computer usable media includes at least one computer program that is capable of causing the computer to perform:

- receiving a command from an application program for at least one variable maintained by the operating system;
- determining whether the requested at least one variable is in a data object;
- if the requested at least one variable is in the data object, returning the at least one variable to the application program; and
- if the requested at least one variable is not in the data object,

Docket No. AT999179  
Firm No. 0072.0014

executing the command from the application program to store at least one variable maintained by the operating system in the data object accessible to the application program, wherein the application program is executing on the operating system ; by:

determining an operating system native command from a set of native operating system commands for different types of operating systems to use to retrieve the at least one variable, wherein the application program is capable of executing on each of the different types of operating systems;

executing the determined operating system native command in response to the command from the application program to retrieve the at least one variable into a buffer;

storing the retrieved at least one variable from the buffer into the data object; and

executing the command from the application program to retrieve the at least one variable from the data object for return to the application program.

20. (Cancelled)

21. (Original) The article of manufacture of claim 19, wherein the application program is a first application program, further comprising:

receiving a request from a second application program for at least one variable maintained by the operating system; and

returning the requested at least one variable from the data object populated as a result of the command executed by the first application program.

22. (Previously Presented) The article of manufacture of claim 19, wherein the at least one variable retrieved as a result of execution of the command from the application program is a set of environment variables.

23. (Currently Amended) The article of manufacture of claim 19, further comprising:

Docket No. AT999179  
Firm No. 0072.0014

determining a type of the operating system; and  
selecting the operating system native command from a the set of native  
operating system commands for different types of operating systems, wherein the selected  
operating system native command is capable of being executed on the operating system to  
retrieve the at least one variable; and wherein the application program is capable of executing on  
each of the different types of operating systems.

24. (Previously Presented) The article of manufacture of claim 19, wherein the  
command from the application program and the operating system native command are executed  
in a first process and the application program is executed in a second process.

25. (Previously Presented) The article of manufacture of claim 19, wherein the  
command from the application program is for storing multiple variables, and wherein retrieving  
the variables comprises generating a data stream including the variables, and further comprising:  
reading the retrieved variables from the data stream into the buffer; and  
processing each line in the buffer to determine each variable name and value, wherein  
each determined variable name and value is stored in the data object.

26. (Original) The article of manufacture of claim 25, wherein determining each  
variable name and value comprises:

determining a location of an equal sign;  
setting the variable name to the string preceding the equal sign; and  
setting the variable value to the string following the equal sign.

27. (Previously Presented) The article of manufacture of claim 26, wherein the  
variable name and value for each variable are maintained on at least one line, further comprising:  
processing each line in the data stream line-by-line;
